The S12VR family is based on a process combining NVM, digital logic and high-voltage analog components into a monolithic solution. These analog components include an automotive voltage regulator, LIN physical layer, low-side drivers, high-side drivers and inputs. The new high-voltage devices are capable of withstanding the rigorous requirements of the automotive environment (up to 40V), which can happen during load dump conditions and are integrated with the industry-proven 16-bit S12 CPU and memory subsystem consisting of ECC-protected flash memory and real EEPROM. This S12 CPU is fully compatible with the S12G family of cost-effective, highly-integrated MCUs. That compatibility extends to the digital peripherals included in the S12VR, such as SPI, SCI serial modules, PWM and timer modules.

The S12VR combines all the elements of a system that saves valuable PCB space, simplifies design and increases overall system quality and reduces cost. A smaller PCB means smaller enclosures for automotive and industrial applications where every bit of weight removed increases fuel efficiency. The integration of different components on the S12VR reduces time-to-market by requiring less development time to get to a complete solution.

S12VR-family with the integrated LIN-PHY received approval from major car OEMs for LIN conformance and EMC requirements and is now as well offered up to 125°C ambient temperatures.

Features

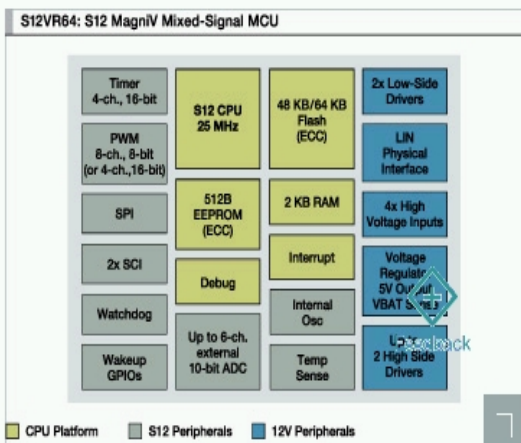

- S12 CPU core, 25 MHz bus
- Up to 64 KB flash with ECC
- 512 B EEPROM with ECC
- 2 KB on-chip SRAM
- LIN physical layer
- Voltage regulator
- Two low side drivers to drive inductive loads
- Up to two high-side drivers
- 4 High-voltage inputs
- This product is included in Freescale's [product longevity program](#), with assured supply for a minimum of 15 years after launch
- Ultra-Reliable MCUs
