CMOS 8/16 Channel Analog Multiplexers

ADG506A/ADG507A

FEATURES
- 44V Supply Maximum Rating
- V_{SS} to V_{DD} Analog Signal Range
- Single/Dual Supply Specifications
- Wide Supply Ranges (10.8V to 16.5V)
- Extended Plastic Temperature Range (−40°C to +85°C)
- Low Power Dissipation (28mW max)
- Low Leakage (20pA typ)
- Available in 28-Lead DIP, SOIC, PLCC and LCCC Packages
- Superior Alternative to:
  - DG506A, HI-506
  - DG507A, HI-507

GENERAL DESCRIPTION

The ADG506A and ADG507A are CMOS monolithic analog multiplexers with 16 channels and dual 8 channels respectively. The ADG506A switches one of 16 inputs to a common output depending on the state of four binary addresses and an enable input. The ADG507A switches one of 8 differential inputs to a common differential output depending on the state of three binary addresses and an enable input. Both devices have TTL and 5V CMOS logic compatible digital inputs.

The ADG506A and ADG507A are designed on an enhanced LC^2MOS process which gives an increased signal capability of V_{SS} to V_{DD} and enables operation over a wide range of supply voltages. The devices can comfortably operate anywhere in the 10.8V to 16.5V single or dual supply range. These multiplexers also feature high switching speeds and low R_{ON}.

PRODUCT HIGHLIGHTS

1. Single/Dual Supply Specifications with a Wide Tolerance:
   The devices are specified in the 10.8V to 16.5V range for both single and dual supplies.
2. Extended Signal Range:
   The enhanced LC^2MOS processing results in a high breakdown and an increased analog signal range of V_{SS} to V_{DD}.
3. Break-Before-Make Switching:
   Switches are guaranteed break-before-make so that input signals are protected against momentary shorting.
4. Low Leakage:
   Leakage currents in the range of 20pA make these multiplexers suitable for high precision circuits.

NOTE
[1]Overvoltage at A, EN, S or D will be clamped by diodes. Current should be limited to the Maximum Rating above.

*COMMENT: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAUTION

ESD (Electro-Static-Discharge) sensitive device. The digital control inputs are diode protected; however, permanent damage may occur on unconnected devices subject to high energy electrostatic fields. Unused devices must be stored in conductive foam or shunts. The protective foam should be discharged to the destination socket before devices are removed.

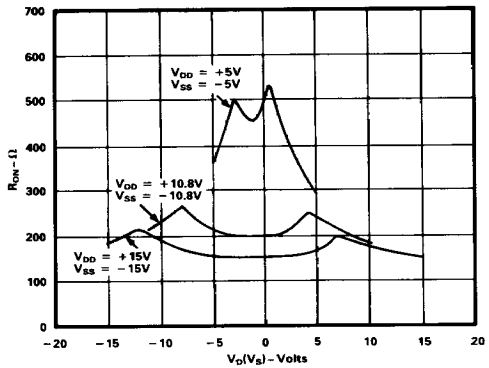
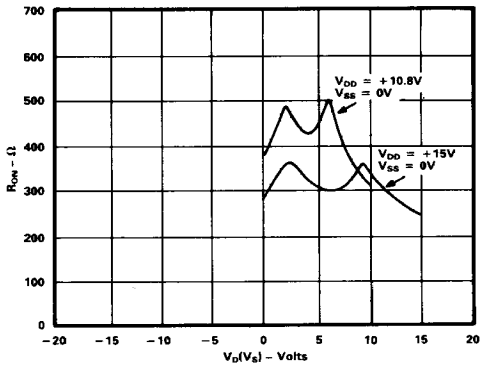
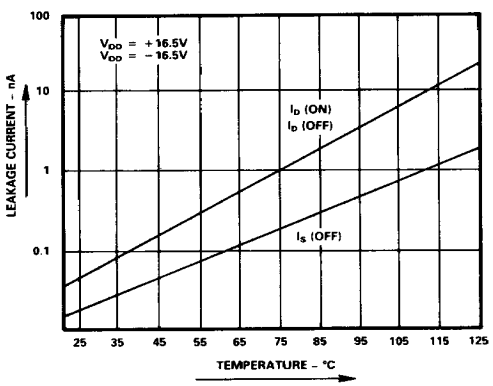
The multiplexers are guaranteed functional with reduced single or dual supplies down to 4.5V.



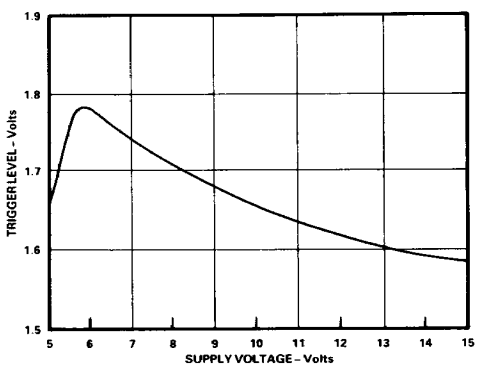
R_{ON} as a Function of $V_D(V_S)$: Dual Supply Voltage, T_A = +25°C



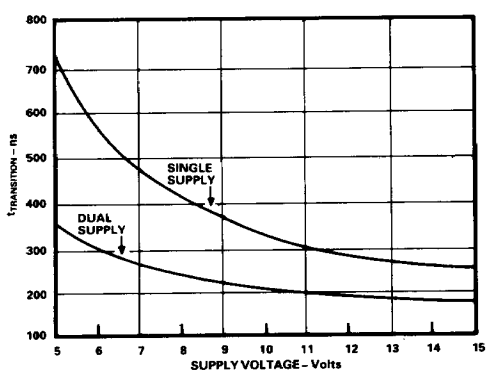
R_{ON} as a Function of $V_D(V_S)$: Single Supply Voltage, T_A = +25°C



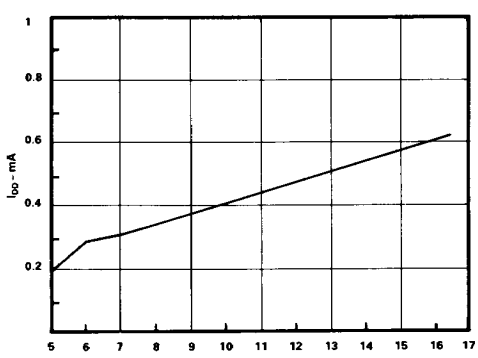
Leakage Current as a Function of Temperature (Note: Leakage Currents Reduce as the Supply Voltages Reduce)



Trigger Levels vs. Power Supply Voltage, Dual or Single Supply, T_A = +25°C



$t_{TRANSITION}$ vs. Supply Voltage: Dual and Single Supplies, T_A = +25°C (Note: For V_{DD} and $|V_{SS}| < 10V$; V1 = V_{DD}/V_{SS}, V2 = V_{SS}/V_{DD}. See Test Circuit 6)



I_{DD} vs. Supply Voltage: Dual or Single Supply, T_A = +25°C

SINGLE SUPPLY AUTOMATIVE APPLICATION

The excellent performance of the multiplexers under single supply conditions makes the ADG506A/ADG507A suitable in applications, such as automotive and disc drives, where only positive power supply voltages are normally available. The following application circuit shows the ADG507A connected as an 8-channel differential multiplexer in an automotive, data acquisition application circuit.

The AD7580 is a 10-bit successive approximation ADC which has an on-chip sample-hold amplifier and provides a conversion result in 20μs. The ADC has a differential analog inputs and is configured in the application circuit for a span of 2.5V over a common-mode range 0 to +5V. Wider common-mode ranges can be accomodated. See the AD7579/AD7580 data sheet for more details. The complete system operates from +12V (±10%) and +5V supplies. The analog input signals to the ADG507A contain information such as temperature, pressure, speed etc.
