

## Smart High-Side Power Switch

Two Channels: 2 x 30mΩ

Current Sense

### Product Summary

Operating Voltage	$V_{bb(on)}$	5.0...34V	
Active channels:		one	two parallel
On-state Resistance	$R_{ON}$	30mΩ	15mΩ
Load Current (ISO)	$I_{L(ISO)}$	12A	24A
Current Limitation	$I_{L(SCr)}$	24A	24A

### Package

### General Description

- N channel vertical power MOSFET with charge pump, ground referenced CMOS compatible input, diagnostic feedback and proportional load current sense monolithically integrated in Smart SIPMOS® technology.
- Fully protected by embedded protection functions

### Applications

- μC compatible high-side power switch with diagnostic feedback for 12V and 24V grounded loads
- All types of resistive, inductive and capacitive loads
- Most suitable for loads with high inrush currents, so as lamps
- Replaces electromechanical relays, fuses and discrete circuits

### Basic Functions

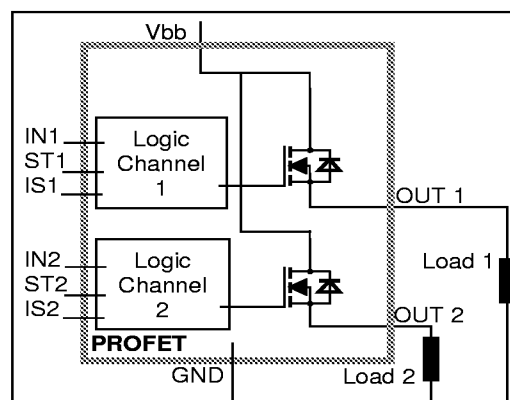

- CMOS compatible input
- Undervoltage and overvoltage shutdown with auto-restart and hysteresis
- Fast demagnetization of inductive loads
- Logic ground independent from load ground

### Protection Functions

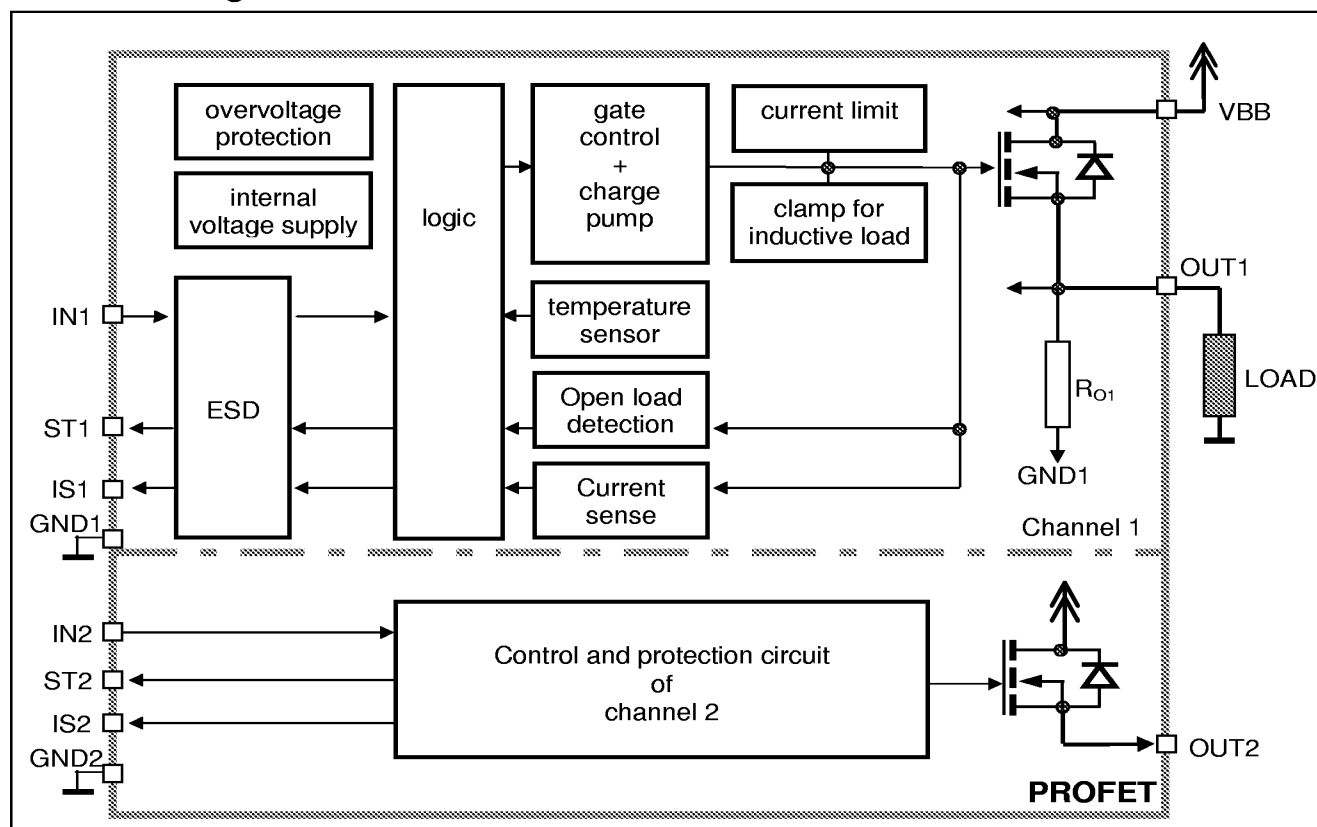

- Short circuit protection
- Overload protection
- Current limitation
- Thermal shutdown
- Overvoltage protection (including load dump) with external resistor
- Reverse battery protection with external resistor
- Loss of ground and loss of  $V_{bb}$  protection
- Electrostatic discharge protection (ESD)

### Diagnostic Functions

- Proportional load current sense
- Diagnostic feedback with open drain output
- Open load detection in OFF-state with external resistor
- Feedback of thermal shutdown in ON-state

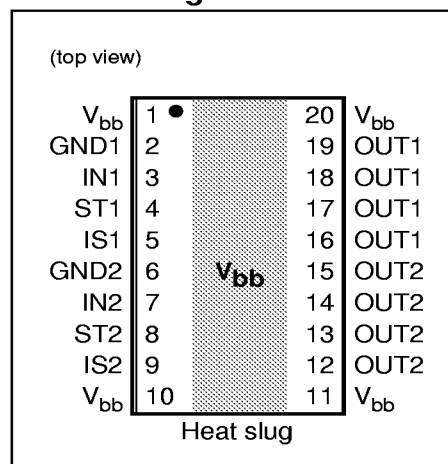

## Functional diagram

## Pin Definitions and Functions

Pin	Symbol	Function
1,10, 11,12,	$V_{bb}$	<b>Positive power supply voltage.</b> For high current applications the heat slug should be used as Vbb connection.
3	IN1	<b>Input 1,2</b> , activates channel 1,2 in case of logic high signal
7	IN2	
16,17, 18,19	OUT1	<b>Output 1,2</b> , protected high-side power output of channel 1,2. All pins of each output have to be connected in parallel for operation according this spec (e.g. $k_{TjIS}$ ). Design the wiring for the max. short circuit current
12,13, 14,15	OUT2	
4	ST1	<b>Diagnostic feedback 1,2</b> of channel 1,2 open drain, invers to input level
8	ST2	
2	GND1	<b>Ground 1,2</b> of chip channel 1,2
6	GND2	
5	IS1	<b>Sense current output 1,2</b> ; proportional to the load current, zero in the case of current limitation of the load current
9	IS2	
Heatslug	$V_{bb}$	<b>Positiv powersupply voltage.</b> Good way to design a very low thermal resistance.

### Reverse Battery

Reverse battery voltage <sup>11)</sup>	$-V_{bb}$	--	--	32	V
Drain-source diode voltage ( $V_{out} > V_{bb}$ ) $I_L = -4.0\text{ A}$ , $T_j = +150^{\circ}\text{C}$	$-V_{ON}$	--	600	--	mV

<sup>7)</sup> Supply voltages higher than  $V_{bb(\text{AZ})}$  require an external current limit for the GND and status pins (a  $150\ \Omega$  resistor in the GND connection is recommended). See also  $V_{ON(\text{CL})}$  in table of protection functions and circuit diagram page 9.

<sup>8)</sup> Measured with load; for the whole device; all channels off

<sup>9)</sup> Add  $I_{ST}$ , if  $I_{ST} > 0$

<sup>10)</sup> If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest  $V_{ON(\text{CL})}$

<sup>11)</sup> Requires a  $150\ \Omega$  resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Power dissipation is higher compared to normal operating conditions due to the voltage drop across the drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 9).

L = "Low" Level      X = don't care      Z = high impedance, potential depends on external circuit  
H = "High" Level      Status signal after the time delay shown in the diagrams (see fig 5. page 13)  
Parallel switching of channel 1 and 2 is possible by connecting the inputs and outputs in parallel. The status outputs ST1 and ST2 have to be configured as a 'Wired OR' function with a single pull-up resistor. The current sense outputs IS1 and IS2 have to be connected with a single pull-down resistor.

## Terms

Leadframe ( $V_{bb}$ ) is connected to pin 1,10,11,12,15,16,19,20

External  $R_{GND}$  optional; two resistors  $R_{GND1}$ ,  $R_{GND2} = 150 \Omega$  or a single resistor  $R_{GND} = 75 \Omega$  for reverse battery protection up to the max. operating voltage.

- <sup>16)</sup> The voltage drop over the power transistor is  $V_{bb} - V_{OUT} > 3V$  typ. Under this condition the sense current  $I_{IS}$  is zero
- <sup>17)</sup> An external short of output to  $V_{bb}$ , in the off state, causes an internal current from output to ground. If  $R_{GND}$  is used, an offset voltage at the GND and ST pins will occur and the  $V_{ST\ low}$  signal may be erroneous.
- <sup>18)</sup> Low ohmic short to  $V_{bb}$  may reduce the output current  $I_L$  and therefore also the sense current  $I_{IS}$ .
- <sup>19)</sup> Power Transistor off, high impedance
- <sup>20)</sup> with external resistor between  $V_{bb}$  and OUT

**Input circuit (ESD protection), IN1 or IN2**

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

**Status output, ST1 or ST2**

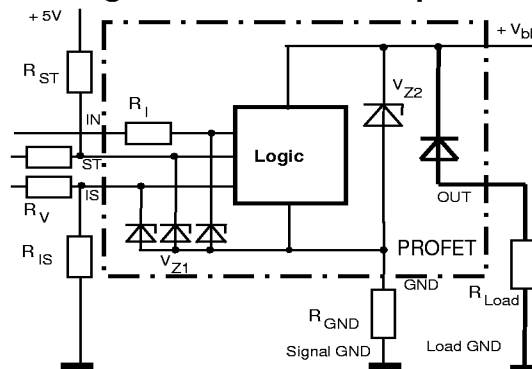

ESD-Zener diode: 6.1 V typ., max 5.0 mA;  $R_{ST(ON)} < 375 \Omega$  at 1.6 mA. The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

**Current sense output**

ESD-Zener diode: 6.1 V typ., max 14 mA;  
 $R_{IS} = 1 \text{ k}\Omega$  nominal

**Inductive and overvoltage output clamp, OUT1 or OUT2**

$V_{ON}$  clamped to  $V_{ON(CL)} = 47 \text{ V typ.}$

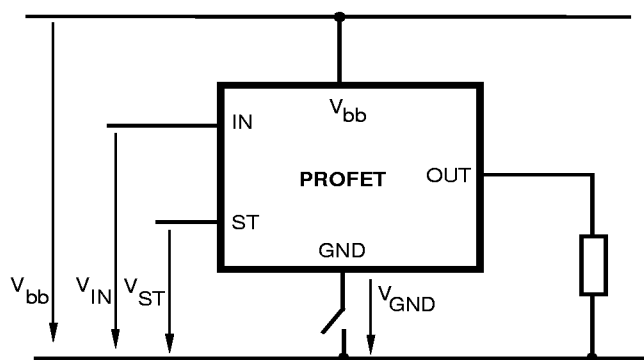

**Overvoltage and reverse batt. protection**

$V_{Z1} = 6.1 \text{ V typ.}$ ,  $V_{Z2} = 47 \text{ V typ.}$ ,  $R_{GND} = 150 \Omega$ ,  
 $R_{ST} = 15 \text{ k}\Omega$ ,  $R_I = 4.5 \text{ k}\Omega \text{ typ.}$ ,  $R_{IS} = 1 \text{ k}\Omega$ ,  $R_V = 15 \text{ k}\Omega$ ,  
In case of reverse battery the current has to be limited by the load. Temperature protection is not active

**Open-load detection OUT1 or OUT2**

OFF-state diagnostic condition:

$V_{OUT} > 3 \text{ V typ.}$ ; IN low

**GND disconnect**

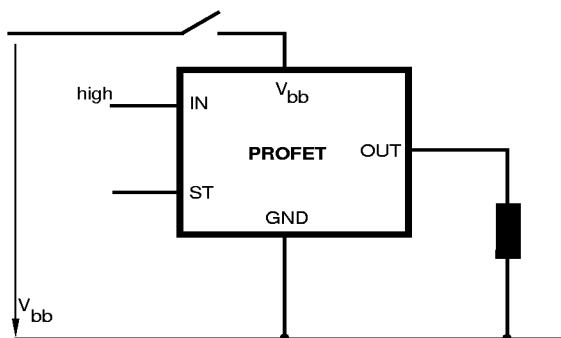

Any kind of load. In case of IN = high is  $V_{OUT} \approx V_{IN} - V_{IN(T+)}$ .  
Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low signal}$  available.

## GND disconnect with GND pull up

Any kind of load. If  $V_{GND} > V_{IN} - V_{IN(T+)}$  device stays off  
Due to  $V_{GND} > 0$ , no  $V_{ST}$  = low signal available.

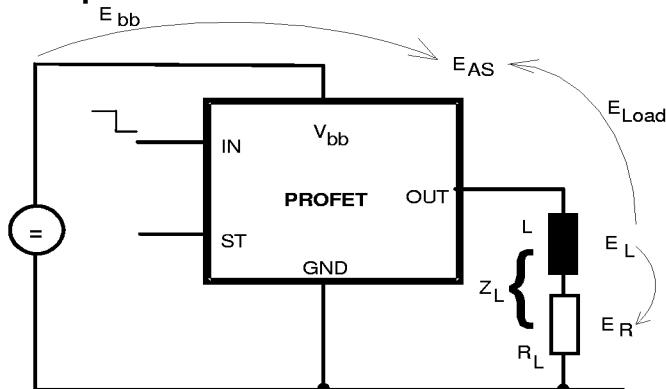

## V<sub>bb</sub> disconnect with energized inductive load

For inductive load currents up to the limits defined by  $Z_L$  (max. ratings and diagram on page 10) each switch is protected against loss of  $V_{bb}$ .

Consider at your PCB layout that in the case of  $V_{bb}$  disconnection with energized inductive load all the load current flows through the GND connection.

## Inductive load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for  $R_L > 0 \Omega$ :

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left( 1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

## Maximum allowable load inductance for a single switch off (one channel)<sup>4)</sup>

$L = f(I_L)$ ;  $T_{j,start} = 150^\circ\text{C}$ ,  $V_{bb} = 12\text{V}$ ,  $R_L = 0 \Omega$

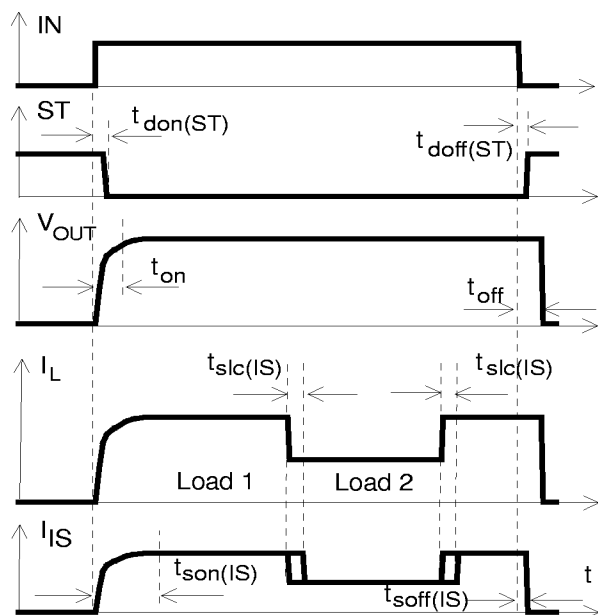

$Z_L$  [mH]
