

LM431

Adjustable Precision Zener Shunt Regulator

General Description

The LM431 is a 3-terminal adjustable shunt regulator with guaranteed temperature stability over the entire temperature range of operation. The output voltage may be set at any level greater than 2.5V (V_{REF}) up to 36V merely by selecting two external resistors that act as a voltage divided network. Due to the sharp turn-on characteristics this device is an excellent replacement for many zener diode applications.

Features

- Average temperature coefficient 50 ppm/°C
- Temperature compensated for operation over the full temperature range
- Programmable output voltage
- Fast turn-on response
- Low output noise

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Electrical specifications do not apply when operating the device beyond its rated operating conditions.

Note 2: $T_{J\text{Max}} = 150^\circ\text{C}$.

Note 3: Ratings apply to ambient temperature at 25°C . Above this temperature, derate the TO-92 at $6.2\text{ mW}/^\circ\text{C}$, the SO-8 at $6.5\text{ mW}/^\circ\text{C}$, the SOT-23 at $2.2\text{ mW}/^\circ\text{C}$.

Note 4: Deviation of reference input voltage, V_{DEV} , is defined as the maximum variation of the reference input voltage over the full temperature range.

1005507

The average temperature coefficient of the reference input voltage, V_{REF} , is defined as:

$$\propto V_{REF} \frac{\text{ppm}}{^{\circ}\text{C}} = \frac{\pm \left[\frac{V_{\text{Max}} - V_{\text{Min}}}{V_{\text{REF}} (\text{at } 25^{\circ}\text{C})} \right] 10^6}{T_2 - T_1} = \pm \left[\frac{V_{\text{DEV}}}{V_{\text{REF}} (\text{at } 25^{\circ}\text{C})} \right] 10^6$$

Where:

$T_2 - T_1$ = full temperature change (0-70°C).

V_{REF} can be positive or negative depending on whether the slope is positive or negative.

Example: $V_{\text{DEV}} = 8.0 \text{ mV}$, $V_{\text{REF}} = 2495 \text{ mV}$, $T_2 - T_1 = 70^{\circ}\text{C}$, slope is positive.

$$\propto V_{REF} = \frac{\left[\frac{8.0 \text{ mV}}{2495 \text{ mV}} \right] 10^6}{70^{\circ}\text{C}} = +46 \text{ ppm}/^{\circ}\text{C}$$

Note 5: The dynamic output impedance, r_z , is defined as:

$$r_z = \frac{\Delta V_Z}{\Delta I_Z}$$

When the device is programmed with two external resistors, R_1 and R_2 , (see [Figure 2](#)), the dynamic output impedance of the overall circuit, r_z , is defined as:

$$r_z = \frac{\Delta V_Z}{\Delta I_Z} \approx \left[r_z \left(1 + \frac{R_1}{R_2} \right) \right]$$

Typical Performance Characteristics

Note: The areas under the curves represent conditions that may cause the device to oscillate. For curves B, C, and D, R2 and V+ were adjusted to establish the initial V_Z and I_Z conditions with $C_L = 0$. V+ and C_L were then adjusted to determine the ranges of stability.
