# High-Speed, Single-Supply, Rail-to-Rail OPERATIONAL AMPLIFIERS MicroAmplifier ${ }^{\text {TM }}$ Series 

## FEATURES

- RAIL-TO-RAIL INPUT
- RAIL-TO-RAIL OUTPUT (within 10mV)
- WIDE BANDWIDTH: 38MHz
- HIGH SLEW RATE: 22V/ $\mu \mathrm{s}$
- LOW NOISE: $5 \mathrm{nV} / \sqrt{\mathrm{Hz}}$
- LOW THD+NOISE: 0.0006\%
- UNITY-GAIN STABLE
- MicroSIZE PACKAGES
- SINGLE, DUAL, AND QUAD

## APPLICATIONS

- CELL PHONE PA CONTROL LOOPS
- DRIVING A/D CONVERTERS
- VIDEO PROCESSING
- DATA ACQUISITION
- PROCESS CONTROL
- AUDIO PROCESSING
- COMMUNICATIONS
- ACTIVE FILTERS
- TEST EQUIPMENT

## DESCRIPTION

The OPA350 series rail-to-rail CMOS operational amplifiers are optimized for low voltage, single-supply operation. Rail-to-rail input/output, low noise ( $5 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ ), and high speed operation ( $38 \mathrm{MHz}, 22 \mathrm{~V} / \mu \mathrm{s}$ ) make them ideal for driving sampling Analog-to-Digital (A/D) converters. They are also well suited for cell phone PA control loops and video processing ( $75 \Omega$ drive capability) as well as audio and general purpose applications. Single, dual, and quad versions have identical specifications for maximum design flexibility.
The OPA350 series operates on a single supply as low as 2.5 V with an input common-mode voltage range that extends 300 mV below ground and 300 mV above the positive supply. Output voltage swing is to within 10 mV of the supply rails with a $10 \mathrm{k} \Omega$ load. Dual and quad designs feature completely independent circuitry for lowest crosstalk and freedom from interaction.

The single (OPA350) and dual (OPA2350) come in the miniature MSOP-8 surface mount, SO-8 surface mount, and DIP-8 packages. The quad (OPA4350) packages are the space-saving SSOP-16 surface mount and SO-14 surface mount. All are specified from $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ and operate from $-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$.

SPICE model available at www.ti.com

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet. OPA4350

## ABSOLUTE MAXIMUM RATINGS(1)

Supply Voltage ............................................. . 7.0 V
Signal Input Terminals(2), Voltage ..... (V-) - 0.3V to (V+) +0.3 V
Current.......................... . 10mA
Open Short-Circuit Current(3) ....................... . . Continuous
Operating Temperature Range................$-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Storage Temperature Range . . . . . . . . . . . . . . . . . . $-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Junction Temperature . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $+150^{\circ} \mathrm{C}$
Lead Temperature (soldering, 10s) ............................ $+300^{\circ} \mathrm{C}$
(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.3 V beyond the supply rails should be current limited to 10 mA or less.
(3) Short-circuit to ground, one amplifier per package.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PACKAGE/ORDERING INFORMATION(1)

| PRODUCT | PACKAGE-LEAD | PACKAGE DESIGNATOR | SPECIFIED TEMPERATURE RANGE | PACKAGE MARKING | ORDERING NUMBER | TRANSPORT MEDIA, QUANTITY |

200ns/div

OPA350 series op amps are fabricated on a state-of-the-art 0.6 micron CMOS process. They are unity-gain stable and suitable for a wide range of general-purpose applications. Rail-to-rail input/output make them ideal for driving sampling A/D converters. They are also well-suited for controlling the output power in cell phones. These applications often require high speed and low noise. In addition, the OPA350 series offers a low-cost solution for general-purpose and consumer video applications ( $75 \Omega$ drive capability).
Excellent ac performance makes the OPA350 series well-suited for audio applications. Their bandwidth, slew rate, low noise ( $5 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ ), low THD ( $0.0006 \%$ ), and small package options are ideal for these applications. The class $A B$ output stage is capable of driving $600 \Omega$ loads connected to any point between $\mathrm{V}_{+}$ and ground.
Rail-to-rail input and output swing significantly increases dynamic range, especially in low voltage supply applications. Figure 1 shows the input and output waveforms for the OPA350 in unity-gain configuration. Operation is from a single +5 V supply with a $1 \mathrm{k} \Omega$ load connected to $\mathrm{V}_{\mathrm{S}} / 2$. The input is a $5 \mathrm{~V}_{\mathrm{PP}}$ sinusoid. Output voltage swing is approximately 4.95 V Pp.

Power supply pins should be bypassed with $0.01 \mu \mathrm{~F}$ ceramic capacitors.

Figure 1. Rail-to-Rail Input and Output

## OPERATING VOLTAGE

OPA350 series op amps are fully specified from +2.7 V to +5.5 V . However, supply voltage may range from +2.5 V to +5.5 V . Parameters are tested over the specified supply range-a unique feature of the OPA350 series. In addition, many specifications apply from $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$. Most behavior remains virtually unchanged throughout the full operating voltage range. Parameters that vary significantly with operating voltage or temperature are shown in the typical characteristics.

## RAIL-TO-RAIL INPUT

The tested input common-mode voltage range of the OPA350 series extends 100 mV beyond the supply rails. This is achieved with a complementary input stage-an N-channel input differential pair in parallel with a P-channel differential pair, as shown in Figure 2. The N -channel pair is active for input voltages close to the positive rail, typically $(\mathrm{V}+)-1.8 \mathrm{~V}$ to 100 mV above the positive supply, while the P -channel pair is on for inputs from 100 mV below the negative supply to approximately $(\mathrm{V}+)-1.8 \mathrm{~V}$. There is a small transition region, typically $\left(\mathrm{V}_{+}\right)-2 \mathrm{~V}$ to $(\mathrm{V}+)-1.6 \mathrm{~V}$, in which both pairs are on. This 400 mV transition region can vary $\pm 400 \mathrm{mV}$ with process variation. Thus, the transition region (both input stages on) can range from ( $\mathrm{V}_{+}$) 2.4 V to $(\mathrm{V}+)-2.0 \mathrm{~V}$ on the low end, up to $(\mathrm{V}+)-1.6 \mathrm{~V}$ to $(\mathrm{V}+)-1.2 \mathrm{~V}$ on the high end.
OPA350 series op amps are laser-trimmed to reduce offset voltage difference between the N -channel and P-channel input stages, resulting in improved common-mode rejection and a smooth transition between the N -channel pair and the P -channel pair. However, within the 400 mV transition region PSRR, CMRR, offset voltage, offset drift, and THD may be degraded compared to operation outside this region.
A double-folded cascode adds the signal from the two input pairs and presents a differential signal to the class $A B$ output stage. Normally, input bias current is approximately 500fA. However, large inputs (greater than 300 mV beyond the supply rails) can turn on the OPA350's input protection diodes, causing excessive current to flow in or out of the input pins. Momentary voltages greater than 300 mV beyond the power supply can be tolerated if the current on the input pins is limited to 10 mA . This is easily accomplished with an input resistor, as shown in Figure 3. Many input signals are inherently current-limited to less than 10 mA ; therefore, a limiting resistor is not required.

Figure 2. Simplified Schematic

Figure 3. Input Current Protection for Voltages Exceeding the Supply Voltage

## RAIL-TO-RAIL OUTPUT

A class AB output stage with common-source transistors is used to achieve rail-to-rail output. For light resistive loads ( $>10 \mathrm{k} \Omega$ ), the output voltage swing is typically ten millivolts from the supply rails. With heavier resistive loads $(600 \Omega$ to $10 \mathrm{k} \Omega)$, the output can swing to
within a few tens of millivolts from the supply rails and maintain high open-loop gain. See the typical characteristics Output Voltage Swing vs Output Current and Open-Loop Gain vs Output Voltage.

## CAPACITIVE LOAD AND STABILITY

OPA350 series op amps can drive a wide range of capacitive loads. However, all op amps under certain conditions may become unstable. Op amp configuration, gain, and load value are just a few of the factors to consider when determining stability. An op amp in unity-gain configuration is the most susceptible to the effects of capacitive load. The capacitive load reacts with the op amp's output impedance, along with any additional load resistance, to create a pole in the small-signal response that degrades the phase margin.

In unity gain, OPA350 series op amps perform well with very large capacitive loads. Increasing gain enhances the amplifier's ability to drive more capacitance. The typical characteristic Small-Signal Overshoot vs Capacitive Load shows performance with a $1 \mathrm{k} \Omega$ resistive load. Increasing load resistance improves capacitive load drive capability.

For optimum settling time and stability with high-impedance feedback networks, it may be necessary to add a feedback capacitor across the feedback resistor, $R_{F}$, as shown in Figure 4. This capacitor compensates for the zero created by the feedback network impedance and the OPA350's input capacitance (and any parasitic layout capacitance). The effect becomes more significant with higher impedance networks.

Where $\mathrm{C}_{\text {IN }}$ is equal to the OPA350's input capacitance (approximately 9pF) plus any parasitic layout capacitance.

Figure 4. Feedback Capacitor Improves Dynamic Performance

It is suggested that a variable capacitor be used for the feedback capacitor since input capacitance may vary between op amps and layout capacitance is difficult to determine. For the circuit shown in Figure 4, the value of the variable feedback capacitor should be chosen so that the input resistance times the input capacitance of the OPA350 (typically 9pF) plus the estimated parasitic layout capacitance equals the feedback capacitor times the feedback resistor:

$$
\mathrm{R}_{\mathrm{IN}} \cdot \mathrm{C}_{\mathbb{I N}}=\mathrm{R}_{\mathrm{F}} \cdot \mathrm{C}_{\mathrm{F}}
$$

where $\mathrm{C}_{\mathrm{IN}}$ is equal to the OPA350's input capacitance (sum of differential and common-mode) plus the layout capacitance. The capacitor can be varied until optimum performance is obtained.

## DRIVING A/D CONVERTERS

OPA350 series op amps are optimized for driving medium speed (up to 500 kHz ) sampling $A / D$ converters. However, they also offer excellent performance for higher speed converters. The OPA350
series provides an effective means of buffering the A/D's input capacitance and resulting charge injection while providing signal gain.

Figure 5 shows the OPA350 driving an ADS7861. The ADS7861 is a dual, $500 \mathrm{kHz}, 12$-bit sampling converter in the tiny SSOP-24 package. When used with the miniature package options of the OPA350 series, the combination is ideal for space-limited applications. For further information, consult the ADS7861 data sheet (SBAS110A)

## OUTPUT IMPEDANCE

The low frequency open-loop output impedance of the OPA350's common-source output stage is approximately $1 \mathrm{k} \Omega$. When the op amp is connected with feedback, this value is reduced significantly by the loop gain of the op amp. For example, with 122dB of open-loop gain, the output impedance is reduced in unity-gain to less than $0.001 \Omega$. For each decade rise in the closed-loop gain, the loop gain is reduced by the same amount which results in a ten-fold increase in effective output impedance (see the typical characteristic, Output Impedance vs Frequency).
At higher frequencies, the output impedance will rise as the open-loop gain of the op amp drops. However, at these frequencies the output also becomes capacitive due to parasitic capacitance. This prevents the output impedance from becoming too high, which can cause stability problems when driving capacitive loads. As mentioned previously, the OPA350 has excellent capacitive load drive capability for an op amp with its bandwidth.

## VIDEO LINE DRIVER

Figure 6 shows a circuit for a single supply, $G=2$ composite video line driver. The synchronized outputs of a composite video line driver extend below ground. As shown, the input to the op amp should be ac-coupled and shifted positively to provide adequate signal swing to account for these negative signals in a single-supply configuration.

The input is terminated with a $75 \Omega$ resistor and ac-coupled with a $47 \mu \mathrm{~F}$ capacitor to a voltage divider that provides the dc bias point to the input. In Figure 6, this point is approximately (V-) + 1.7V. Setting the optimal bias point requires some understanding of the nature of composite video signals. For best performance, one should be careful to avoid the distortion caused by the transition region of the OPA350's complementary input stage. Refer to the discussion of rail-to-rail input.

$\mathrm{V}_{\text {IN }}=0 \mathrm{~V}$ to 2.45 V for 0 V to 4.9 V output.
Choose $\mathrm{C}_{\mathrm{B} 1}, \mathrm{C}_{\mathrm{B} 0}, \mathrm{C}_{\mathrm{A} 1}, \mathrm{C}_{\mathrm{A} 0}$ to filter high frequency noise.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb -Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS \& no $\mathbf{S b} / \mathrm{Br}$ ): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine ( Br ) and Antimony ( Sb ) based flame retardants ( Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents Tl's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

DBQ (R-PDSO-G16)
PLASTIC SMALL-OUTLINE PACKAGE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion not to exceed $0.006(0,15)$ per side.
D. Falls within JEDEC MO-137 variation AB.

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. Publication IPC-7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a $50 \%$ volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to Tl's terms and conditions of sale supplied at the time of order acknowledgment.
TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with Tl's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.
TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.
TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.
Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. Tl is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.
TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
